

DeePower

RENEWABLE ENERGY POWER PLANT MANAGEMENT

Summary

This presentation introduces the core idea of the DeePower, a service platform aimed to centralize the data storage, visual analytics, forecasting modeling and insight reporting of the efficiency from renewable energy power plants.

Presented by Fernando Borbón, PhD.

DEEPOWER

VALUE PROPOSAL

Renewable energy power plant operators can benefit from a service platform to centralize the data management of their energy assets, forecast their performance and scale with their portfolio expansion. This can lead to data based investment strategies to optimize their infrastructure revenue.

STRATEGIC INVESTMENT

IBERIAN PENINSULA SCENARIO

An energy utility has to decide the next infrastructure investment to optimize power production, storage, hydrogen generation and energy transportation

Options:

- Deploy new transmission lines to Madrid?
- Build a new wind farm in Canarias islands ?
- Install energy storage in Andalucía?

DEEPOWER

PROBLEM STATEMENT

Renewable energy power plants produce and consume large amount of data, from scada monitoring systems to control signals and weather measurements and forecasting.

It is a challenge to coordinate their management in an optimized way and have a global overview to conduct smart investments.

DEEPOWER

PROPOSED SOLUTION

A service platform to centralize the data acquisition, storage, analytics, forecast modeling and insight reporting, scalable to ever changing portfolio size.

Pay
per use

Time saving

Infrastructure
saving

DEEPOWER

BENEFITS

Save valuable resources by avoiding expenditures in own servers, time dedicated to infrastructure management, data curation and model development. Benefit from state of the art analytics and pay proportional to intensity of use.

PROJECT TIMELINE

First MVP focused on wind farms

- Continue problem and solution validation with potential clients.
- Development of MVP in cloud platform.
- Prepare tutorial of platform use and benefits.
